

Abstract

An expandable storage container includes a primary storage container having a series of openings arranged in an upper portion and a cavity on one side, and a secondary storage container arranged at least partially within the primary storage container. The secondary storage container has a series of openings arranged in an upper portion therein, and is sized to be slidably nested within at least a portion of the primary storage container. Items such as knives, rods, screwdrivers, etc. are stored vertically within the openings, and the secondary storage container slides outwardly from the primary storage container to permit additional storage as the use increases the number of items needing storage.
